## Topic 1 Content: Properties of Rockets Notes

### Introduction

#### Properties of Rockets

##### Introduction

Historically, rocket technology has provided humans with the ability to travel into space. In this interactivity, click on the buttons in the lower right corner to view the properties of a rocket. Four major aerodynamic properties are investigated here; thrust, weight, drag and lift.

#### Drag

### Properties of Rockets

#### Drag

The diagram shows a green rocket with a red nose cone and black fins, oriented vertically. Four force vectors are labeled: 'Lift' (blue arrow pointing left), 'Weight' (red arrow pointing right), 'Drag' (blue arrow pointing down), and 'Thrust' (black arrow pointing up from the base). A yellow dot on the rocket's body represents the center of pressure.

Drag is force that only occurs inside the atmosphere or before the rocket escapes from the pull of the Earth, and acts opposite to that of the thrust. This force acts with lift to keep the rocket's center of pressure.

### Lift

**Properties of Rockets**

Lift

Lift, which is mostly perpendicular to drag, keeps the rocket in the air. This force acts with drag to create a center of pressure.

#### Weight

#### Properties of Rockets

#### Weight

The diagram shows a green rocket with a red nose cone and black fins. Four force vectors are labeled: 'Lift' (blue arrow pointing left), 'Drag' (blue arrow pointing down), 'Thrust' (black arrow pointing up from the engine), and 'Weight' (purple arrow pointing up from the base of the rocket).

Weight is how "heavy" the rocket is. As you can see, the weight will act against the thrust of the rocket. In order to achieve an escape velocity, the rocket must provide the correct thrust.

#### Thrust

**Properties of Rockets**

Thrust

The diagram shows a green rocket with a red nose cone and black fins. Four force vectors are labeled: 'Lift' (blue arrow pointing left), 'Drag' (blue arrow pointing down), 'Weight' (red arrow pointing down), and 'Thrust' (purple arrow pointing up from the engine nozzle).

Thrust is the force of the engines acting against the rocket. The amount of thrust is important to counteract the weight of the rocket and to achieve the correct velocity to enter space.
