

Ideal Gas Law

Ideal Gas Law

Module 9: States of Matter and Gas Laws

Topic 4 Content: Ideal Gas Law Presentation Notes

$$\frac{P_1 V_1}{T_1 n_1} = \frac{P_2 V_2}{T_2 n_2}$$
$$R = \frac{PV}{Tn}$$
$$PV = nRT$$

ideal gas constant

The Combined Gas Law shows you the relationship of a gas is inversely proportional to volume and directly proportional to temperature. Avogadro's Law showed you that volume and pressure are directly proportional to the number of moles of a gas. If you combine both of these gas laws, you can derive the following equation: $P_1 \times V_1/T_1 \times n_1 = P_2 \times V_2/T_2 \times n_2$.

Just like all of the other gas laws, the Ideal Gas Law is a single equation that relates the variables of pressure, volume, temperature, and number of moles of an ideal gas. Using R for the constant, the simplified equation becomes: $R = P \times V/T \times n$.

This equation is simplified one more time and becomes: $PV=nRT$. In this equation, the variable R is called the ideal gas constant.

Ideal Gas Constant

universal gas constant

derived based on experimentation

depends on the units chosen for pressure, temperature, and volume

can have different values

$62.3637 \frac{\text{L}\cdot\text{mmHg}}{\text{mol}\cdot\text{K}}$ $0.08205 \frac{\text{L}\cdot\text{atm}}{\text{mol}\cdot\text{K}}$ $8.3145 \frac{\text{L}\cdot\text{kPa}}{\text{mol}\cdot\text{K}}$

R is the ideal gas constant. Sometimes, it is referred to as the universal gas constant. It has been derived based on experimentation. The value of R depends on the units chosen for pressure, temperature, and volume in the ideal gas equation. You must use Kelvin for temperature, and use SI units for volume. Since you can use different units for pressure, R can have different values.

Module 9: States of Matter and Gas Laws
Topic 4 Content: Ideal Gas Law Presentation Notes

What volume is occupied by 3.760 g of oxygen gas at a pressure of 88.4 kPa and a temperature of 25°C?
Assume the oxygen is an ideal gas.

Known

$$P = 88.4 \text{ kPa}$$

$$T = 25^\circ\text{C} + 273 = 298\text{K}$$

$$\text{Mass } \text{O}_2 = 3.760 \text{ g}$$

$$\text{O}_2 = 32.00 \text{ g/mol}$$

$$R = 8.3145 \frac{\text{L}\cdot\text{kPa}}{\text{mol}\cdot\text{K}}$$

Unknown

$$V = ?$$

Now, try this sample problem using the Ideal Gas Law equation.

What volume is occupied by 3.760 g of oxygen gas at a pressure of 88.4 kPa and a temperature of 25°C? Assume the oxygen is an ideal gas.

The best way to solve this problem is to list the known and unknown variables and then solve the problem using mathematics. You will notice that the temperature is listed in Celsius and needs to be converted to Kelvin. Try to solve this problem on your own, and then click **NEXT** to view the solution.

$$\frac{3.760 \text{ g of O}_2}{32.00 \text{ g O}_2} \times \frac{1.0 \text{ mol O}_2}{1.0 \text{ mol O}_2} = 0.1175 \text{ mol O}_2$$
$$PV = nRT$$
$$V = \frac{nRT}{P}$$
$$\frac{0.1175 \text{ mol} \times 8.3145 \frac{\text{L}\cdot\text{kPa}}{\text{mol}\cdot\text{K}} \times 298 \text{ K}}{88.4 \text{ kPa}} = 3.29 \text{ L O}_2$$

In order to use the ideal gas law equation, you must first determine the number of moles of O₂. In order to complete this important step, you will use the given mass and the molar mass. To calculate the number of moles multiply 3.760 g of O₂ by 1.0 mol of O₂. Then, divide by 32.00 g of O₂. The amount of O₂ equals 0.1175 mol.

Then, use the ideal gas equation to solve for the volume of oxygen. You must rearrange the ideal gas law to solve for V. Now, plug in your known values and solve for V. You can see that V equals 0.1175 mol times 8.3145 kPa • L/K • mol x 298 K divided by 88.4 kPa. The volume is equal to 3.29 L of O₂.
